

### GM Hi-Tech Kickdown Kit Installation Instructions For TH350, 700-R4, TH200, TH200-4R, and 4L60

#### **General Installation Notes:**

Please read these instructions completely before beginning the installation. If you have any questions, please call.

Before beginning the installation, disconnect the negative battery cable and use wheel chocks to block the vehicle's wheels.

Make sure the engine, transmission, body and frame are properly grounded. We recommend using anti-seize lubricant on all aluminum threads.

**NOTE:** This Lokar Kickdown Kit is designed to be installed with a Lokar Carburetor Bracket and Springs, part # SRK-4000 (not included, available separately). The Lokar Kickdown Cable is designed to be cut-to-fit.

#### Refer to Figs. 1, 2 and 3 for the component names.

- Step 1: Remove the cable end stop, kickdown throttle body fitting, and kickdown cable adjuster from the new Lokar Kickdown Cable. DO NOT remove the ferrule from the cable housing if the cable housing is braided stainless steel. Fig. 4
   Leave the kickdown mounting bracket on the kickdown cable adjuster. Remove the inner wire from the cable housing.
- Step 2: From the engine end of the kickdown cable housing, install the tube hold down clip onto the cable housing with the lip pointed downwards, and slide it down to the trans tube at the end of the cable housing. Temporarily install the cable housing into the transmission without the o-ring(s) and inner wire.
   Note: Some original kickdown cables used a top-hat style seal in the transmission. Verify that there isn't a seal remaining in the kickdown cable hole in the transmission.

Loosely install the bolt for the tube hold down clip, to keep the cable housing from accidentally coming out of the transmission. *Fig. 5* 

*Note*: TH200 and TH350 transmissions could have come with either a standard or a metric bolt for the trans tube hold down clip. For those applications, we have included both a standard 1/4"-20 and a metric M6 bolt and lock washer for the trans tube hold down clip. The standard 1/4"-20 bolt has a rounded button head, and the metric M6 bolt has a square-shouldered socket head. *Fig. 2* The TH200-4R, 700-R4, and 4L60 will only have a metric bolt and washer in the kit.

Step 3: If the throttle cable has already been installed, disconnect the throttle cable from the carburetor. If the engine already has a Lokar Carburetor Bracket installed, remove the throttle cable adjuster. Leave the Carburetor Bracket in place. If the engine does not have a Lokar Carburetor Bracket already installed, install one now, following the installation instructions that were provided with the Lokar Carburetor Bracket (not included).

Step 4: The kickdown mounting bracket mounts onto the back side of the Lokar Carburetor Bracket. The throttle cable adjuster will pass through the top hole in both the new kickdown mounting bracket AND the Carburetor Bracket. Position the kickdown mounting bracket behind the Carburetor Bracket so that the 5/16" diameter holes at the top of both brackets are aligned, the small 3/16" diameter holes near the center of the two brackets are aligned, and the kickdown cable adjuster is offset towards the left side of the vehicle.

> Attach the kickdown mounting bracket to the Carburetor Bracket using the supplied #8-32 x 1/2" button head bolt and nylock nut through the small 3/16" diameter center holes in both brackets, but do not tighten yet. Insert the throttle cable adjuster (with the rear nut still installed) from the rear through the top holes in both brackets. Position the throttle cable adjuster so that the bracket is roughly centered in the threaded part of the cable adjuster. Install the front adjuster nut.

Tighten the throttle cable adjuster nuts, the button head bolt and nut, and the kickdown cable adjuster nuts. *Fig. 6* 

Step 11: This step will also be much easier with a helper. Slide the kickdown cable end stop onto the inner wire. Move the throttle to wide open and hold it there while pulling the kickdown inner wire as tight as possible. Slide the cable end stop up against the kickdown throttle body fitting and tighten the set screw using the supplied 5/64" Allen wrench. Release the throttle. When the Kickdown Cable is properly adjusted you should be able to open the throttle to the wide open position without interference from the Kickdown Cable; and with the throttle wide open, you should not be able to pull the Kickdown Cable out any further.

Double check to be sure that all carburetor, throttle and kickdown linkage operates freely without binding. Then, test drive the vehicle. Once the Kickdown Cable is correctly adjusted and operating properly you can cut off the excess inner wire, leaving about 1/2" extending beyond the cable end stop to allow for future adjustment if needed. Final installation should look like *Fig. 7* and *Fig. 8*.

Step 10: Before connecting the Kickdown Cable to the

carburetor, make sure that the throttle linkage is

properly adjusted. Verify at the carburetor that the

throttle is wide open while you have a helper hold

the accelerator pedal to the floor. Once you are

sure that the throttle linkage is adjusted correctly, slide the kickdown throttle body fitting onto the

kickdown cable inner wire, and connect the kickdown throttle body fitting to the hex carb fitting.
